The purpose of the Clinical Corner is to provide responses to clinically oriented questions which may not, in many cases, have been evaluated yet by research. Therefore, the personal opinions expressed in the column are the opinions of the individual authors, often based on their clinical experience, and are not necessarily those of ISNR or the Journal of Neurotherapy. Nonetheless, it is hoped that the diversity of opinion expressed in this column will stimulate thought and the further exchange of ideas.

Readers are invited to send questions for consideration to: D. Corydon Hammond, PhD, University of Utah School of Medicine, PM&R, 30 North 1900 East, Salt Lake City, UT 84132. E-mail address: <D.C. Hammond@m.cc.utah.edu>.

The question posed this month was, “What effects does caffeine have on the brain, behavior, and the EEG?”
